EDITOR---In a new series of papers (1) the BMJ will address the extremely important issue of living with a chronic disease. We know that a high percentage of the population will suffer from one or more chronic health conditions and most from one or more symptoms of ill health at any given time (2,3).

It is therefore important to teach the patient to cope with the present state of health and we believe that it is even more important to inspire and coach the patient to work on improving quality of life (QOL), subjective health and functional ability in general (4-17). We even believe that patient has the potential in some cases to cure themselves and improve QOL, even when the physician has given up (18-21), because one can grow as a person and heal basic existence (20). The fundamental difficulty seems to be the development of the patients consciousness towards a more positive, responsible and constructive attitude (20-23).

When Aldous Huxley said, “Experience is not what happens to a man; it is what a man does with what happens to him”(24). This opens up for more possibilities that just “giving patients time and space to talk about what happens to them to improve their experiences of illness” (1), it is the whole life that can be improved, in many cases including the fundamental health, as we have shown in a resent series of papers on holistic medicine (25-38).

So we want to reframe: “the patient's journey travelling through life with a chronic illness” to “the patient's journey travelling through life fighting a chronic illness”. We need as physicians a
much more supportive and positive approach to the patient and to the project of mobilising his/her hidden resources using the possibilities to grow and develop as a person.

The support of the patient as a whole, resourceful person is one of the most important aspects of today’s medical practice with the chronic patient. The most important aspects of life to deepen the understanding must embrace:

- The map: an outline of the natural course of the disease – with and without the effort of the patient to improve own life (global QOL, general health, ability) (5-38)
- The good and bad news: What's wrong with me? What is going to happen to me? How is it going to end? And most importantly: what can I do myself to fight this disease and improve my QOL and my health? (5-10)
- Learning from your chronic disease: how to take responsibility for your own QOL (9,11,15,22,23,24-38)
- Travelling alone or travelling with others – which is basically the patients choice in many cases
- Losing independence and dealing with changing relationships and social roles
- Companions on the journey: Friends and family, professionals, support organisations
- Ways of coping, ways of improving QOL and health, ways of healing yourself (20,21,25-38)
- What I need along the way: Information, help, treatment, coaching, love and inspiration [22,25-38]
- Losing the path and finding it again: Other problems that may arise over time [9]
- Travellers' tales and tales from exceptional patients of personal success showing what to do with impossible situations: One or more brief stories and quotes from real patients—highlighted by one 300-word personal account (38)
- Journey's end including examples of patients dying the “good death” (11)

AFFILIATION

Søren Ventegodt, MD, is a general practitioner and the director of the Quality of Life Research Center in Copenhagen, Denmark. E-mail: ventegodt@livskvalitet.org Website: www.livskvalitet.org/

Mohammed Morad, MD, is a family physician, the medical director of a large area clinic in the city of Beer-Sheva, Israel. E-mail: morad62@barak-online.net

Joav Merrick, MD, DMSc is professor of child health and human development, director of the National Institute of Child Health and Human Development and the medical director of the Division for Mental Retardation, Ministry of Social Affairs, Jerusalem, Israel.
